  Question : What Danish director is the director of Oslo, August 31st distantl
y related to?
  Correct  : Lars von Trier
  Wrong    : yes

=== Sample RAGTruth hallucinated row ===
  Source   : {'name': 'Siam Elephant', 'address': '509 Linden Ave', 'city': 'Ca
rpinteria', 'state': 'CA', 'categories': 'Restaurants,...
  Response : Siam Elephant is a highly-rated Thai restaurant located in Carpint
eria, CA. According to customer reviews, the restaurant offers fresh, delicious
food with a variety of options, including Pan Thai Noodles, spring rolls, and R
ed meat Wonton Soup. The restaurant has a clean and welcoming atmosphere, with
elephant-themed decor throughout. The menu offers both indoor and outdoor seati
ng, and takeout is also available. Additionally, the restaurant has free parkin
g for the first 90 minutes. Customers have praised the restaurant's attentive s
ervice and flavorful dishes, with an average rating of 4.5 stars. Some customer
s have noted that the restaurant can be a bit pricey, but most agree that the q
uality of the food and the overall experience make it worth the cost. Overall,
Siam Elephant is a great option for those looking for authentic Thai cuisine in
the Carpinteria area.

=== Sample MedHallu correct/wrong pair ===
  Question : Is duration of psychological treatment for depression related to r
```

```
eturn into treatment?
  Correct  : The results suggest that a longer duration of treatment may preven
t return into mental health care in some groups. However, because of the design
of the study, no causal inference can be drawn. Further research, preferably in
a RCT, is needed to determine whether the trend towards lower intensity treatme
nts is associated with repeated mental health care use.
  Wrong    : Availability of sports facilities is significantly associated with
leisure time sports participation among Dutch adolescents, alongside the impact
of neighborhood social capital (NSC).
```

# ============================================================
# SECTION 5 — FEATURE EXTRACTION  —  FINAL + ALL ANALYTICS
# Authors: Akshita Singh, Prabesh Paudel, Siddhartha Roy
# Khoury College, Northeastern University
#
# What this section does:
#   Extracts 18 circuit-level signals from Gemma-2-9B activations
#   for every (source, question, answer) triple in our training data
#   and the AggreFact OOD benchmark. Then runs every possible
#   pre-extraction diagnostic so we understand our data BEFORE
#   spending 5+ GPU hours on extraction.
#
# Why we built it this way:
#   Our core hypothesis is that transformer internals carry richer
#   hallucination signal than output-level metrics (perplexity, logits).
#   We extract activations from residual stream, attention heads, and
#   MLP outputs — then check which ones actually discriminate
#   hallucinated vs faithful answers before training any classifier.
#
# SummaC removed — null result documented here so no one repeats it:
#   Added in a previous iteration expecting the summarization S9 gap
#   to bridge. Section 9+9C proved zero improvement. The actual gap
#   is src_max=1200 (train) vs 3000 (AggreFact OOD) — a context
#   length mismatch that causes S2/S4/S7/S12 to invert direction.
#   Fix is src_max=2000 for all training in next run + FEVER data.
#
# Leakage/bias prevention (reviewed together as a team):
#   ✅ 70/15/15 stratified by dataset×label, random_state=42
#   ✅ ALL scalers fitted on train rows only
#   ✅ Signal power computed on train rows only — val/test never seen
```

```
#   ✅ AggreFact: OOD eval only, zero training involvement
#   ✅ he_mean_prob compression check on HaluEval val only
#   ✅ ANLI: human-annotated adversarial NLI, not LLM-generated
#   ✅ SummaC removed — honest null result, not buried
# ============================================================

# ============================================================
# SECTION 6 — AUGMENTATION, SCALING & CLASSIFIER TRAINING
# Authors: Akshita Singh, Prabesh Paudel, Siddhartha Roy
# Khoury College, Northeastern University
#
# What this section does:
#   Takes raw 1447-d feature vectors from Section 5 and builds
#   the complete classification pipeline:
#   1. Dynamic FIXED_WINDOW via per-layer S2 AUC on RAGTruth
#      training rows (3-fold CV, no val leakage ever)
#   2. AHI weights (per-head discriminability, RAGTruth train only)
#   3. Orthogonalization of S13/S14/S16-18 against confounders
```

```
#   4. Scaler selection (ragtruth: best RT AUC + HE veto)
#   5. Augmented 1451-d feature matrix
#   6. Train 5 classifiers + RagtStacking (RT-optimized)
#   7. Full per-dataset, per-regime, per-LLM evaluation
#   8. All possible diagnostic plots
#
# Why these design choices:
#   AHI: 672 attention heads are not equally discriminative.
#        Weighting by per-head RAGTruth AUC gives a single
#        strong signal that survives OOD (AUC=0.648 on AggreFact).
#   Orthogonalization: S13/S14/S17/S18 share variance with S6/S2.
#        Without it the classifier double-counts the same information.
#   RagtStacking: trained on RT-only rows captures multi-LLM
#        patterns diluted in the full 72k training set.
#        Gives us F1=0.7135 vs ReDeEP token 0.7132.
#
# All possible plots included:
#   6A: Per-layer S2/S1/S4/S3 discriminability (6 regimes)
#   6B: AHI weight heatmap + head importance + distribution
#   6C: Orthogonalization effectiveness (before/after)
#   6D: Classifier comparison (AUC/F1/BalAcc/ROC/PR)
#   6E: Feature importance + signal ablation
#   6F: Scaler comparison + selection verification
#   6G: AggreFact OOD diagnostic (informational only)
#   6H: Per-LLM RAGTruth breakdown (core paper contribution)
#   6I: Learning curves (training size vs performance)
#   6J: Stacking meta-learner analysis
#   6K: Threshold sensitivity analysis
#   6L: RagtStacking vs Stacking per-LLM comparison
#
# Leakage prevention (checked as a team):
#   ✅ FIXED_WINDOW: 3-fold CV on RAGTruth TRAIN rows only
#   ✅ AHI weights: fitted on RAGTruth TRAIN rows only
#   ✅ Scaler: fitted on TRAIN rows only
#   ✅ Orthogonalization: OLS coefficients from TRAIN rows only
#   ✅ AggreFact: loaded for post-hoc diagnostics only
#   ✅ Val/test split: same seed as Section 5
# ============================================================

# ============================================================
# SECTION 7 — CALIBRATION
# Authors: Akshita Singh, Prabesh Paudel, Siddhartha Roy
# Khoury College, Northeastern University
#
# What this section does:
#   Raw classifier probabilities from Section 6 are overconfident —
#   pushed too close to 0 and 1. We apply a two-stage calibration:
#   1. Temperature scaling: single global T that softens logits
#   2. Isotonic regression per regime: non-parametric monotone mapping
#      fitted on calibrated val probabilities
#
#   Three calibrators are fitted:
#     iso_reg   — global (all val rows, baseline)
#     iso_qa    — QA regime (HaluEval val only, RAGTruth excluded)
#     iso_claim — claim regime (MiniCheck+ANLI val, RAGTruth excluded)
#
#   Routing at inference:
#     RAGTruth → Stacking/RagtStacking → iso_reg
#     QA (non-RT) → Stacking → iso_qa
#     Claim → Stacking → iso_claim
#     Other → Stacking → iso_reg
#
# Why three calibrators:
#   QA and claim regime have fundamentally different score
#   distributions. A single calibrator fitted on the full val set
#   is dominated by QA rows (largest regime) and miscalibrates
#   claim predictions. Per-regime isotonic fixes this.
#   RAGTruth QA excluded from iso_qa because RT S9≈2.79 scaled
#   vs HaluEval S9≈-0.35 — completely different distribution.
#
# All possible analyses included:
#   7A: Temperature sweep — AUC/ECE/BalAcc/Brier vs T
#   7B: Reliability diagrams per calibration stage
#   7C: Per-dataset calibration quality
#   7D: Per-regime reliability diagrams
#   7E: Isotonic mapping functions (what iso does to scores)
#   7F: Score distribution through calibration pipeline
#   7G: ECE decomposition (reliability + resolution + uncertainty)
#   7H: Calibration at multiple T values (2D heatmap)
#   7I: All classifiers calibrated comparison
#   7J: AggreFact calibration preview (diagnostic only)
#   7K: Calibration summary and routing verification
#
# Leakage prevention (reviewed as a team):
```

```python
#   ✅ iso_qa: fitted on HaluEval VAL only, not test
#   ✅ iso_claim: fitted on MiniCheck+ANLI VAL claim rows
#   ✅ RAGTruth excluded from iso_qa and iso_claim fitting
#   ✅ Temperature T tuned on val ECE, not test BalAcc
#   ✅ AggreFact never used for any calibration decision

# ============================================================
# SECTION 8 — FINAL EVALUATION (COMPLETE — ALL MODELS)
# Authors: Akshita Singh, Prabesh Paudel, Siddhartha Roy
# Khoury College, Northeastern University
#
# Fully model-agnostic: Gemma-2-9B, Qwen2.5-7B, Qwen2.5-1.5B,
# LLaMA-3-8B, Pythia-1.4B, GPT-2 Small/XL.
#
# Design: BOTH Stacking AND RagtStacking evaluated everywhere.
# 4 systems compared throughout:
```

```
#   1. Stacking raw (no calibration)
#   2. Stacking + 3-tier calibration
#   3. RagtStacking raw (no calibration)
#   4. RagtStacking + 3-tier calibration
# Routed = RAGTruth→Ragt, Others→Stack (primary paper number)
#
# Plots:
#   8A: Per-dataset — all 4 systems, AUC/F1/BalAcc/ROC/PR/Brier/ECE
#   8B: Per-LLM + AggreFact OOD — Stack vs Ragt side-by-side
#   8C: Per-layer S1/S2/S3/S4 on test AND AggreFact OOD
#   8D: All 18 signals + AHI AUC — test AND AggreFact OOD
#   8E: AggreFact OOD detailed — both classifiers, per-subdataset
#   8F: Error analysis — TP/TN/FP/FN for both classifiers
#   8G: Length/KS diagnostics + complete results summary
#
# Textual/Tabular analysis (T1–T10):
#   T1: AUC table  — all 4 systems × all datasets
#   T2: F1 table   — all 4 systems × all datasets
#   T3: BalAcc table — all 4 systems × all datasets
#   T4: Winner per dataset decision table
#   T5: Calibration gain (raw→cal) per dataset
#   T6: Per-LLM RAGTruth detailed
#   T7: AggreFact OOD per-subdataset + root cause
#   T8: Signal stability test vs OOD
#   T9: Per-layer regime analysis
#   T10: Final clean paper numbers
#
# Leakage prevention:
#   ✅ All thresholds fitted on VAL only, applied to TEST
#   ✅ AggreFact never in any training or calibration decision
#   ✅ Test split identical seed to Sections 5/6/7

Stable: 6 Inverted: 8 Total: 19

Circuit interpretation:
Internal-state signals (AHI, S17) transfer well — measure head-level and token-level patterns unaffected by source document length.
Source-attention signals (S2, S4) degrade — longer context changes what the model attends to, making training-set patterns stale.
→ Validates hypothesis: internal circuit signals more robust OOD.

T9: PER-LAYER S2 ANALYSIS — Test Split

Model: qwen25_05b NL=24 NH=14 Total heads: 336
FIXED_WINDOW: [6, 7, 8, 9, 10, 11, 12]
Best S2 layer on test: L11 (46% depth)
In FIXED_WINDOW: ✅ yes
S2 AUC at best layer: 0.4398
S2 AUC averaged over FIXED_WINDOW: 0.4361

Regime	Train_BL	Test_BL	Δ_layers	Consistent
claim	20(83%)	16(67%)	-4	⚠ shifted
data2txt	17(71%)	0(0%)	-17	⚠ shifted
qa	17(71%)	11(46%)	-6	⚠ shifted
summary	16(67%)	0(0%)	-16	⚠ shifted

Paper finding: Different regimes activate at different layer depths.
QA/RAGTruth: shallower layers (factual retrieval is early).
Claim/NLI: deeper layers (logical reasoning is late).
→ Justifies regime-adaptive FIXED_WINDOW design.
→ FIXED_WINDOW targets the most discriminative region for RAGTruth.

T10: FINAL PAPER NUMBERS — COMPLETE CLEAN SUMMARY

MODEL: qwen25_05b | NL=24 NH=14 Heads: 336
Architecture: 739d raw → 743d augmented
