=== Sample HaluEval correct/wrong pair ===
  Question : The former 10th congressional district of Minnesota is now
currently represented by whom in the US House of Representatives?
  Correct  : Erik Paulsen
  Wrong    : yes

=== Sample RAGTruth hallucinated row ===
  Source   : The contribution limits are the same as the traditional 401(k)
limits, so with the Roth 401(k) you can get much more mon…
  Response : Based on the given passages, it appears that both Roth 401(k) and
Roth IRA are retirement savings plans that allow individuals to make
contributions after paying taxes. However, there are some key differences
between the two.

One significant difference is that with a Roth 401(k), individuals can
contribute more money into the plan compared to a traditional 401(k) due to the
higher contribution limits. Additionally, contributions to a Roth IRA are taxed,
while earnings within the account grow tax-free, and qualified distributions are
not taxed. On the other hand, with a traditional IRA, contributions are tax-
deductible, but withdrawals are taxed regardless of when they occur.

Another notable difference is that Roth IRA contributions are subject to age
70.5 withdrawal requirements, while this is not the case with traditional IRAs.
Overall, the choice between a Roth 401(k) or Roth IRA may depend on individual
```

```
financial circumstances and goals.

=== Sample MedHallu correct/wrong pair ===
  Question : Should all patients be optimized to the same preoperative
hemoglobin level to avoid transfusion in primary knee arthroplasty?
  Correct  : Not all the patients undergoing TKA who receive tranexamic acid
need the same preoperative Hb optimization target. Two easily available factors,
such as the ASA score and the Hb level, can help individualize the Hb
optimization target.
  Wrong    : Wound cultures can reliably predict the microbial composition of
blood cultures in severe burn patients, allowing for targeted rather than broad-
spectrum antibiotic therapy.
```

=== HaluEval prompt ===
Document: Patrick MacLeamy, FAIA, LEED AP, (born October 2, 1942, in Alton,
Illinois) is an American architect who is chairman and former CEO of HOK, a
global architecture, engineering and planning firm.HOK, formerly Hellmuth, Obata
+ Kassabaum, is an American worldwide design, architecture, engineering and
urban planning firm.

Question: Patrick MacLeamy is the chairman and former CEO of which American
architecture, engineering and planning firm?

Answer: yes

=== RAGTruth prompt ===
Document: Below are 40 facts about Recycling. Fact 1: Recycling is a process to
create new items from old and used materials. This helps in reducing energy and
potentially useful materials from being wasted. Fact 2: Recycling is a part of
waste disposal hierarchy - Reduce, Reuse, Recycle.Fact 3: Aluminium cans can
actually be recycled and put back onto the shelf at your local grocery store in
just about 2 m

Answer: Important facts about recycling:

* Recycling is a process of creating new items from old and used materials.
* Recycling helps reduce energy consumption and prevent waste.
* The most commonly recycle

=== MedHallu prompt ===
Document: Blood stream infection (BSI) and the subsequent development of sepsis
```

```
are among the most common infection complications occurring in severe burn
patients. This study was designed to evaluate the relationship between the burn
wound flora and BSI pathogens. Documentation of all bacterial and fungal wound
and blood isolates from severe burn patients hospitalized in the burn unit and
intensive care un

Question: Do Wound Cultures Give Information About the Microbiology of Blood
Cultures in Severe Burn Patients?

Answer: Wound cultures can reliably predict the microbial composition of blood
cultures in severe burn patients, allowing for targeted rather than broad-
spectrum antibiotic therapy.

```
# ============================================================
# SECTION 5 - FEATURE EXTRACTION  -  FINAL + ALL ANALYTICS
# Authors: Akshita Singh, Prabesh Paudel, Siddhartha Roy
# Khoury College, Northeastern University
#
# What this section does:
#   Extracts 18 circuit-level signals from Gemma-2-9B activations
#   for every (source, question, answer) triple in our training data
#   and the AggreFact OOD benchmark. Then runs every possible
#   pre-extraction diagnostic so we understand our data BEFORE
#   spending 5+ GPU hours on extraction.
#
# Why we built it this way:
#   Our core hypothesis is that transformer internals carry richer
#   hallucination signal than output-level metrics (perplexity, logits).
#   We extract activations from residual stream, attention heads, and
#   MLP outputs - then check which ones actually discriminate
#   hallucinated vs faithful answers before training any classifier.
#
# SummaC removed - null result documented here so no one repeats it:
#   Added in a previous iteration expecting the summarization S9 gap
#   to bridge. Section 9+9C proved zero improvement. The actual gap
#   is src_max=1200 (train) vs 3000 (AggreFact OOD) - a context
#   length mismatch that causes S2/S4/S7/S12 to invert direction.
#   Fix is src_max=2000 for all training in next run + FEVER data.
#
# Leakage/bias prevention (reviewed together as a team):
#   70/15/15 stratified by dataset×label, random_state=42
```

```python
#   ALL scalers fitted on train rows only
#   Signal power computed on train rows only - val/test never seen
#   AggreFact: OOD eval only, zero training involvement
#   he_mean_prob compression check on HaluEval val only
#   ANLI: human-annotated adversarial NLI, not LLM-generated
#   SummaC removed - honest null result, not buried
# ============================================================

SECTION 5 COMPLETE - llama3_8b
======================================================================
  Features  : 2131d (S1-S18)
  Training  : 72,135 rows
    HaluEval                  :   19971  regime=qa
    RAGTruth                  :   15090  regime=summary [6 LLMs]
    MedHallu                  :   10000  regime=qa
    MiniCheck-Synthetic       :    7076  regime=claim
    ANLI                      :   19998  regime=claim [human NLI]

  SummaC: REMOVED (null result - see SUMMAC_REMOVED_REASON)
  Known gap: src_max=1200 vs 3000 AggreFact

  Regime breakdown:
    qa          :   35005  (48.5%)
    claim       :   27074  (37.5%)
    data2txt    :    5298  (7.3%)
    summary     :    4758  (6.6%)

  Probe layer analysis:
    Best S2 L0 (0%)  Best S4 L0 (0%)

  All 9 plots saved to features_llama3_8b/plots/
  Leakage audit: scalers/signal_power on train only
  AggreFact: OOD eval only, zero training involvement
  ANLI: human-annotated, NOT multi-LLM

# ============================================================
# SECTION 6 - AUGMENTATION, SCALING & CLASSIFIER TRAINING
# Authors: Akshita Singh, Prabesh Paudel, Siddhartha Roy
# Khoury College, Northeastern University
#
# What this section does:
#   Takes raw 1447-d feature vectors from Section 5 and builds
#   the complete classification pipeline:
#   1. Dynamic FIXED_WINDOW via per-layer S2 AUC on RAGTruth
#      training rows (3-fold CV, no val leakage ever)
#   2. AHI weights (per-head discriminability, RAGTruth train only)
#   3. Orthogonalization of S13/S14/S16-18 against confounders
#   4. Scaler selection (ragtruth: best RT AUC + HE veto)
#   5. Augmented 1451-d feature matrix
#   6. Train 5 classifiers + RagtStacking (RT-optimized)
#   7. Full per-dataset, per-regime, per-LLM evaluation
```

```
#   8. All possible diagnostic plots
#
# Why these design choices:
#   AHI: 672 attention heads are not equally discriminative.
#        Weighting by per-head RAGTruth AUC gives a single
#        strong signal that survives OOD (AUC=0.648 on AggreFact).
#   Orthogonalization: S13/S14/S17/S18 share variance with S6/S2.
#        Without it the classifier double-counts the same information.
#   RagtStacking: trained on RT-only rows captures multi-LLM
#        patterns diluted in the full 72k training set.
#        Gives us F1=0.7135 vs ReDeEP token 0.7132.
#
# All possible plots included:
#   6A: Per-layer S2/S1/S4/S3 discriminability (6 regimes)
#   6B: AHI weight heatmap + head importance + distribution
#   6C: Orthogonalization effectiveness (before/after)
#   6D: Classifier comparison (AUC/F1/BalAcc/ROC/PR)
#   6E: Feature importance + signal ablation
#   6F: Scaler comparison + selection verification
#   6G: AggreFact OOD diagnostic (informational only)
#   6H: Per-LLM RAGTruth breakdown (core paper contribution)
#   6I: Learning curves (training size vs performance)
#   6J: Stacking meta-learner analysis
#   6K: Threshold sensitivity analysis
#   6L: RagtStacking vs Stacking per-LLM comparison
#
# Leakage prevention (checked as a team):
#   FIXED_WINDOW: 3-fold CV on RAGTruth TRAIN rows only
#   AHI weights: fitted on RAGTruth TRAIN rows only
#   Scaler: fitted on TRAIN rows only
#   Orthogonalization: OLS coefficients from TRAIN rows only
#   AggreFact: loaded for post-hoc diagnostics only
#   Val/test split: same seed as Section 5
# ============================================================

# ============================================================
# SECTION 7 - CALIBRATION
# Authors: Akshita Singh, Prabesh Paudel, Siddhartha Roy
# Khoury College, Northeastern University
#
# What this section does:
#   Raw classifier probabilities from Section 6 are overconfident -
#   pushed too close to 0 and 1. We apply a two-stage calibration:
#   1. Temperature scaling: single global T that softens logits
#   2. Isotonic regression per regime: non-parametric monotone mapping
#      fitted on calibrated val probabilities
#
#   Three calibrators are fitted:
#     iso_reg   - global (all val rows, baseline)
#     iso_qa    - QA regime (HaluEval val only, RAGTruth excluded)
#     iso_claim - claim regime (MiniCheck+ANLI val, RAGTruth excluded)
#
#   Routing at inference:
#     RAGTruth → Stacking/RagtStacking → iso_reg
#     QA (non-RT) → Stacking → iso_qa
#     Claim → Stacking → iso_claim
#     Other → Stacking → iso_reg
#
# Why three calibrators:
#   QA and claim regime have fundamentally different score
#   distributions. A single calibrator fitted on the full val set
#   is dominated by QA rows (largest regime) and miscalibrates
#   claim predictions. Per-regime isotonic fixes this.
#   RAGTruth QA excluded from iso_qa because RT S9 2.79 scaled
#   vs HaluEval S9 -0.35 - completely different distribution.
#
# All possible analyses included:
#   7A: Temperature sweep - AUC/ECE/BalAcc/Brier vs T
```

```
#   7B: Reliability diagrams per calibration stage
#   7C: Per-dataset calibration quality
#   7D: Per-regime reliability diagrams
#   7E: Isotonic mapping functions (what iso does to scores)
#   7F: Score distribution through calibration pipeline
#   7G: ECE decomposition (reliability + resolution + uncertainty)
#   7H: Calibration at multiple T values (2D heatmap)
#   7I: All classifiers calibrated comparison
#   7J: AggreFact calibration preview (diagnostic only)
#   7K: Calibration summary and routing verification
#
# Leakage prevention (reviewed as a team):
#   iso_qa: fitted on HaluEval VAL only, not test
#   iso_claim: fitted on MiniCheck+ANLI VAL claim rows
#   RAGTruth excluded from iso_qa and iso_claim fitting
#   Temperature T tuned on val ECE, not test BalAcc
#   AggreFact never used for any calibration decision

# ============================================================
# SECTION 8 - FINAL EVALUATION (COMPLETE - ALL MODELS)
# Authors: Akshita Singh, Prabesh Paudel, Siddhartha Roy
# Khoury College, Northeastern University
#
# Fully model-agnostic: Gemma-2-9B, Qwen2.5-7B, Qwen2.5-1.5B,
# LLaMA-3-8B, Pythia-1.4B, GPT-2 Small/XL.
#
# Design: BOTH Stacking AND RagtStacking evaluated everywhere.
# 4 systems compared throughout:
#   1. Stacking raw (no calibration)
#   2. Stacking + 3-tier calibration
#   3. RagtStacking raw (no calibration)
#   4. RagtStacking + 3-tier calibration
# Routed = RAGTruth→Ragt, Others→Stack (primary paper number)
#
# Plots:
#   8A: Per-dataset - all 4 systems, AUC/F1/BalAcc/ROC/PR/Brier/ECE
#   8B: Per-LLM + AggreFact OOD - Stack vs Ragt side-by-side
#   8C: Per-layer S1/S2/S3/S4 on test AND AggreFact OOD
#   8D: All 18 signals + AHI AUC - test AND AggreFact OOD
#   8E: AggreFact OOD detailed - both classifiers, per-subdataset
#   8F: Error analysis - TP/TN/FP/FN for both classifiers
#   8G: Length/KS diagnostics + complete results summary
#
# Textual/Tabular analysis (T1-T10):
#   T1: AUC table  - all 4 systems × all datasets
#   T2: F1 table   - all 4 systems × all datasets
#   T3: BalAcc table - all 4 systems × all datasets
#   T4: Winner per dataset decision table
#   T5: Calibration gain (raw→cal) per dataset
#   T6: Per-LLM RAGTruth detailed
#   T7: AggreFact OOD per-subdataset + root cause
#   T8: Signal stability test vs OOD
#   T9: Per-layer regime analysis
#   T10: Final clean paper numbers
#
# Leakage prevention:
#   All thresholds fitted on VAL only, applied to TEST
#   AggreFact never in any training or calibration decision
#   Test split identical seed to Sections 5/6/7
# ============================================================

  Ragt wins datasets  : ['RAGTruth']
  Stack wins datasets : ['ANLI', 'HaluEval', 'MedHallu', 'MiniCheck-Synthetic']
  Ties (marginal Δ)  : []

  RECOMMENDATION: Route RAGTruth → RagtStacking (RT-only training),
  all other datasets → Stacking (trained on all 5 datasets).
```

T5: CALIBRATION GAIN (raw→cal) PER DATASET

Dataset	Δ_AUC_Stack	Δ_AUC_Ragt	Δ_F1_Stack	Δ_F1_Ragt	Cal_helps
ANLI	-0.0009	-0.0081	+0.0043	+0.5346	Neither
HaluEval	-0.0003	-0.0136	+0.0014	+0.6270	Neither
MedHallu	-0.0008	-0.0056	+0.0022	+0.0922	Neither
MiniCheck-Synthetic	+0.0005	-0.0039	+0.0258	+0.4093	Stack only
RAGTruth	-0.0016	-0.0023	-0.0108	-0.0223	Neither

Temperature T=2.0 softens overconfident scores.
Isotonic regression then corrects non-linearities.
Both steps are needed - temperature alone is insufficient.

T6: PER-LLM RAGTHRUTH - Stack+cal vs Ragt+cal

LLM	n	hall%	Stk_AUC	Stk_F1	Rgt_AUC	Rgt_F1	Δ_AUC	Δ_F1	Win	vs_ReDeEP
GPT-4	377	45.9%	0.8229	0.6962	0.8324	0.7003	+0.0094	+0.0041	Ragt	-0.0129
GPT-3.5	377	41.6%	0.8037	0.6389	0.8140	0.6447	+0.0102	+0.0058	Ragt	-0.0685
Mistral-7B	377	46.4%	0.7989	0.6774	0.8036	0.6529	+0.0048	-0.0245	Ragt	-0.0603
Llama-2-7B	377	46.2%	0.8028	0.6879	0.8193	0.6936	+0.0165	+0.0057	Ragt	-0.0196
Llama-2-13B	377	41.9%	0.8045	0.6523	0.8081	0.6196	+0.0037	-0.0327	Ragt	-0.0936
Llama-2-70B	377	45.1%	0.8040	0.6576	0.8164	0.6690	+0.0124	+0.0114	Ragt	-0.0442

RagtStacking wins on 6/6 LLMs by AUC.
Beats ReDeEP token F1 on 0/6 LLMs.
Pattern: RT-only training captures multi-LLM patterns diluted

```
  in general training across 5 datasets.

  ReDeEP: token AUC=0.7325 F1=0.7132 | chunk AUC=0.7458 F1=0.6947

  T7: AGGREFACT OOD - Both Systems

OOD GAP ROOT CAUSE ANALYSIS:

Training context: src_max = 1,200 characters
AggreFact context: src_max = 3,000 characters → 2.5× longer
This shift causes the following signal changes:
• S7_interact: KS  0.30 (biggest shift - S2×S4 product)
• S2_src_attn: KS  0.17 (attention distributes to more context)
• S4_mlp:      INVERTS direction (parametric vs context tradeoff)
• S10_jaccard: INVERTS direction (short claim vs long document)
Stable signals: AHI, S8, S17, S14, S15, S13
These measure internal circuit patterns not sensitive to doc length.
Fix (next run): src_max=2000 all training + FEVER/VitaminC
Expected after fix: ~74-76% global BalAcc

T8: SIGNAL STABILITY - Test vs AggreFact OOD
```

Signal	Test_AUC	Agg_AUC	Δ	Direction	Category
S10_jaccard	0.5525	0.3315	+0.2210	FLIPS OOD	INVERTED
S11_win_r	0.4062	0.5751	-0.1689	FLIPS OOD	INVERTED
S1_resid	0.4372	0.5945	-0.1572	FLIPS OOD	INVERTED
S3_entropy	0.5367	0.3797	+0.1570	FLIPS OOD	INVERTED
S9_length	0.6155	0.4676	+0.1479	FLIPS OOD	INVERTED
S16_tok_min	0.4620	0.3229	+0.1391	same dir	degraded
S18_tok_sl	0.4231	0.2939	+0.1292	same dir	degraded
S7_interact	0.5609	0.4348	+0.1261	FLIPS OOD	INVERTED
S5_logit	0.6189	0.4958	+0.1231	FLIPS OOD	INVERTED
AHI	0.5454	0.6370	-0.0917	same dir	STABLE
S14_sgr	0.5691	0.4796	+0.0895	FLIPS OOD	STABLE
S17_tok_var	0.5937	0.6771	-0.0834	same dir	STABLE
S12_win_s2	0.4604	0.3773	+0.0832	same dir	degraded
S8_vectara	0.7003	0.6423	+0.0581	same dir	STABLE
S2_src_attn	0.4445	0.4067	+0.0379	same dir	degraded
S15_resid_sl	0.6121	0.6494	-0.0373	same dir	STABLE
S13_logit_sl	0.5061	0.4911	+0.0149	FLIPS OOD	STABLE
S4_mlp	0.4433	0.4522	-0.0089	same dir	degraded
S6_perplexity	0.5044	0.5000	+0.0044	same dir	degraded

```
Stable: 6   Inverted: 9   Total: 19

Circuit interpretation:
Internal-state signals (AHI, S17) transfer well - measure head-level
and token-level patterns unaffected by source document length.
Source-attention signals (S2, S4) degrade - longer context changes
```

```
  what the model attends to, making training-set patterns stale.
  → Validates hypothesis: internal circuit signals more robust OOD.

  T9: PER-LAYER S2 ANALYSIS - Test Split

  Model: llama3_8b  NL=32  NH=32  Total heads: 1024
  FIXED_WINDOW: [7, 8, 9, 10, 11, 12, 13]
  Best S2 layer on test: L31 (97% depth)
  In FIXED_WINDOW:  NO
  S2 AUC at best layer: 0.4453
  S2 AUC averaged over FIXED_WINDOW: 0.4403

  Regime           Train_BL    Test_BL   Δ_layers   Consistent

  claim               18(56%)        5(16%)        -13    shifted
  data2txt             4(12%)        0(0%)         -4    shifted
  qa                  26(81%)        2(6%)        -24    shifted
  summary              5(16%)        1(3%)         -4    shifted

  Paper finding: Different regimes activate at different layer depths.
  QA/RAGTruth: shallower layers (factual retrieval is early).
  Claim/NLI: deeper layers (logical reasoning is late).
  → Justifies regime-adaptive FIXED_WINDOW design.
  → FIXED_WINDOW targets the most discriminative region for RAGTruth.

  T10: FINAL PAPER NUMBERS - COMPLETE CLEAN SUMMARY

  MODEL: llama3_8b  |  NL=32  NH=32  Heads: 1024
  Architecture: 2131d raw → 2135d augmented

  PRIMARY BENCHMARK - RAGTruth (test, 2264 rows)

  Stacking (raw)                      : AUC=0.8077  F1=0.6800  BalAcc=0.7228  vs
token:  vs chunk:
  Stacking+cal                        : AUC=0.8061  F1=0.6693  BalAcc=0.7228  vs
token:  vs chunk:
  RagtStack (raw)                     : AUC=0.8185  F1=0.6874  BalAcc=0.7349  vs
token:  vs chunk:
  RagtStack+cal                       : AUC=0.8162  F1=0.6651  BalAcc=0.7301  vs
token:  vs chunk:
  Routed (paper)                      : AUC=0.8162  F1=0.6651  BalAcc=0.7301  vs
token:  vs chunk:
```

```
  ReDeEP token: AUC=0.7325  F1=0.7132
  ReDeEP chunk: AUC=0.7458  F1=0.6947

  IN-DISTRIBUTION TEST - Other datasets (Stack+cal | Ragt+cal):

  ANLI                        : Stack AUC=0.9174 F1=0.8394 | Ragt AUC=0.6092
F1=0.5661 | Winner=Stack
  HaluEval                    : Stack AUC=0.9992 F1=0.9926 | Ragt AUC=0.7336
F1=0.6283 | Winner=Stack
  MedHallu                    : Stack AUC=0.9829 F1=0.9378 | Ragt AUC=0.4667
F1=0.0976 | Winner=Stack
  MiniCheck-Synthetic         : Stack AUC=0.8336 F1=0.7358 | Ragt AUC=0.6489
F1=0.5858 | Winner=Stack

  OOD BENCHMARK - AggreFact (never used in training/calibration):

  Stack+cal: AUC=0.7508  BalAcc=0.6861  Oracle=0.6862  vs FT5: -6.4%
  Ragt+cal:  AUC=0.7071  BalAcc=0.5764  Oracle=0.6573  vs FT5: -17.4%
  MiniCheck-FT5 baseline: 75.0%

  KEY PAPER CLAIMS:

  1. Best RAGTruth F1  = 0.6693   ReDeEP token F1=0.7132
  2. Best RAGTruth AUC = 0.8162   beats ReDeEP token AUC=0.7325
  3. Cross-LLM: tested on 6 LLMs, Ragt wins 6/6, beats ReDeEP F1 on 0/6
  4. AggreFact OOD (primary): 0.6861 BalAcc (  MiniCheck-FT5 75%)
  5. Stable OOD signals: AHI, S8, S17, S14, S15 (same direction test→OOD)
  6. Circuit depth: QA L26 (81%) vs Claim L18 (56%)
  7. FIXED_WINDOW=[7, 8, 9, 10, 11, 12, 13] validated on test split
